

Data and Model Factory Lakehouse

“The Data and Model
Factory Lakehouse is
the foundation on
which Granite is built.”

Heiko Ludwig
Senior Manager, Granite Data Platforms

Comprehensive lineage tracking and visualization tools in Lakehouse ensure we have **complete visibility into data ingestion and model use** throughout the model development lifecycle for Granite.

Sensitive information related to data and model clearances has been blocked.

Data Acquisition

Robust data governance processes overseen by legal and governance focals ensure that data sourced for Granite aligns with corporate policies and is stored appropriately in the DMF Lakehouse.

Data Preprocessing

Technical SMEs at IBM Research’s AI research labs source safety and security data from public and non-public sources and have built bespoke synthetic data pipelines to reinforce Granite safety and security.

Model Creation

Model checkpoints are screened against a suite of safety and security benchmark evaluations, according to an internal model checklist, to ensure that Granite models meet IBM’s rigorous standards for safety and security.

Model Turning

Models should always be deployed responsibly with guardrails enabled. Granite Guardian is a suite of SOTA models designed to detect risks in prompts and responses, ensuring safe and responsible Granite use.

Model Evaluation

In 2025, IBM renewed its partnership with Robust Intelligence (a Cisco company) to do automated red teaming of Granite language models. The partnership ensures third-party model red teaming of Granite model checkpoints pre-release.

Product Infusion

In Q1/25, IBM kicked off a partnership with HiddenLayer, an IBM Ventures Portfolio company, to do manual red teaming sprints of Granite-vision model checkpoints. The partnership allows the team to identify potential vulnerabilities of Granite-vision models.

DMF Library

In 2025, IBM announced a \$100K bug bounty program, in partnership with HackerOne. The program will act as a feedback loop, with ethical white hat hackers providing insights into complex adversarial attacks directly to the Granite team.

User Interface

In partnership with Schellman LLC, the IBM Granite team is embarking on a 42001 compliance audit for the AI management system behind Granite. The ISO 42001 standard is the international standard for the safety, security, and governance of AI management systems.

The DMF Lakehouse stores 2.7 petabytes of data for Granite training, including relevant metadata, under appropriate access controls.¹

2.7PB

The IBM Granite team collaborates closely with IBM Legal, governance focals, and the IBM AI Ethics Board. In 2024, IBM Research reviewed 638 DGRs to ensure data is ethically sourced and compliant with corporate and regulatory requirements.²
